How to Setup the JPGraph/Graphs into your PC

First Download this file (If needed it is already in the system anyways)
https://jpgraph.net/download/

Then Extract it to the Vendor folder in the System (Make sure to Run WinRAR or any other extracting tools you have with Admin Privileges)

And lastly Edit your php.ini file inside xampp/php folder and remove the semicolon behind this: extension=gd

Then run this onto your browser (Make sure the Directory is inside the htdocs folder):
http://localhost/1QCUPROJECT/check.php

And if it says ✅ GD is enabled it is good now.
